

## **DISABLED DRIVERS CONTROLS**

A defective disabled driver's control or fitment that is a testable item justifies failure in the normal way.

The defect description must include an explanation of the control type of fitment and its function so that it is clear it applies only to disabled driver's equipment.

If the disabled driver's control or fitments are additional to and do not adversely affect the normal vehicle equipment, they are not testable items. Any defective additional control or fitment found during the test should be reported as a MINOR.
